REPORT TO THE JUDICIAL COUNCIL

For business meeting on March 15, 2019

Title

Report to the Legislature: Disposition of Criminal Cases According to Race and Ethnicity of Defendant as Required by Penal Code Section 1170.45

Agenda Item Type

Information Only

Date of Report

January 17, 2019

Submitted by

Judicial Council staff

Sal Lempert, 415-865-4559
Sal.Lempert@jud.ca.gov

Executive Summary

Penal Code section 1170.45 directs the Judicial Council to report annually on the statewide disposition of criminal cases according to defendants' race and ethnicity. The Judicial Council staff submitted this annual report on February 22, 2019.

The data used in this report come from the Offender-Based Transaction Statistics data set, which is a compilation of data on adult felony arrest dispositions produced annually by the California Department of Justice. This report describes patterns seen in criminal case dispositions by race/ethnicity and tests whether any available legal or demographic information can account for the patterns seen.

Relevant Previous Council Action

The Judicial Council's Office of Court Research has submitted these annual reports since 2001. The council approved the reports from 2012 through 2017 and directed staff to transmit each year's report to the Legislature. Before 2012, protocol did not require council action on reports that did not include recommendations. Starting this year Criminal Justice Services has assumed responsibility for this annual report, and protocol does not require council action.

Analysis/Rationale

This report presents findings based on three case disposition outcome measures:

- Conviction rates (i.e., whether a case results in a conviction or alternatively in a dismissal or acquittal);
- Conviction offense level (i.e., whether the case resulted in a felony or misdemeanor conviction); and
- Type of sentence (i.e., whether the defendant was sentenced to prison or received a lesser sentence).

For each outcome, descriptive information is presented on patterns seen in the data. In addition to looking at the race/ethnicity breakdown of the data, several other legal and demographic features that may relate to outcomes are also described and analyzed, including gender, age, prior criminal history, and features of the current arrest offense or offenses. Next, statistical testing is used to determine whether race/ethnicity plays a role in predicting disposition outcomes above and beyond differences across groups in these other relevant legal and demographic factors.

The 2018 report indicates that legal factors such as the type of offense and the defendant's prior criminal record exerted the strongest influence on conviction rates, felony versus misdemeanor conviction, and sentencing to prison. More serious offenses and more extensive criminal histories were both associated with higher conviction rates, more felony versus misdemeanor convictions, and more prison sentences.

After controlling for legal factors, the study found that defendant characteristics such as race/ethnicity, gender, and age are still significantly associated with rates of conviction, rates of felony versus misdemeanor convictions, and imposition of a prison versus an intermediate sentence.

After controlling for all available legal and demographic factors, relative to black and white defendants, Hispanic defendants were more likely to be convicted rather than be acquitted or have their cases dismissed; white defendants were less likely to receive a felony versus a misdemeanor conviction when compared to black and Hispanic defendants; and relative to whites, black and Hispanic individuals convicted of a felony were more likely to receive a sentence to prison rather than an intermediate sentence. These findings are consistent with prior years' reports.

Fiscal Impact and Policy Implications

No fiscal impacts or policy implications are associated with this report.

Introduction

Background

This report examines the disposition of criminal cases across racial/ethnic groups as required by Penal Code section 1170.45.¹ In order to identify patterns by race/ethnicity, it also analyzes the impact of age, gender, and legal predictors—including criminal history and type of arrest—on disposition outcomes. This report fulfills the legislative mandate by identifying criminal case disposition outcomes broken out by race/ethnicity based on three distinct outcome measures: conviction rates, level of conviction offense (i.e., felony versus misdemeanor), and whether a prison or lesser sentence was imposed.

Source of Data

The data used in this report come from the Offender-Based Transaction Statistics (OBTS) data set, which is a compilation of data on adult felony arrest dispositions produced annually by the California Department of Justice (DOJ). The DOJ extracts information from their Automated Criminal History System, which is comprised of information reported to the DOJ by law enforcement agencies, prosecutors, and courts through fingerprint cards (FD-249) and *Adult Disposition of Arrest and Court Action* (JUS 8715) forms, on paper or electronically. The OBTS data track the processing of felony arrests from the point of entry into the criminal justice system to the point of final disposition. This data set only contains data for adult felony arrests with final dispositions in 2017. Arrests that occurred before 2017 are included if their final disposition date was in 2017.²

Figure 1 shows the number of dispositions at distinct case processing stages for all OBTS felony arrest dispositions in 2017. The entry point for cases analyzed in this report is a felony arrest. OBTS recorded 218,933 adult felony arrests with final dispositions in calendar year 2017. Of OBTS felony arrest cases, 22 percent were dropped by law enforcement or prosecution before being filed with the court. An arresting agency or the prosecutor may dispose of the case for multiple reasons including insufficient or inadmissible evidence, lack of probable cause, or absence of a witness. The remaining 78 percent (171,197) of cases proceeded to a court disposition. The race/ethnicity breakdown for filed cases closely resembles that of all felony arrest cases. This report focuses on felony defendants with final court dispositions, thus all data and analyses presented in the remainder of the report include only filed cases.³

Analysis

This report presents findings based on three case disposition outcome measures:

- Conviction rates (i.e., whether a case results in a conviction or alternatively in a dismissal or acquittal);

¹ See Appendix A.

² OBTS 2017 Technical Manual.

³ For summary statistics of all felony defendants, see Appendix B, Table B1.

- Conviction offense level (i.e., whether the case resulted in a felony or misdemeanor conviction); and
- Type of sentence (i.e., whether the defendant was sentenced to prison or received a lesser sentence).⁴

For each outcome, descriptive information is presented on patterns seen in the data. In addition to looking at the breakdown of the data by race/ethnicity, several other legal and demographic features that may relate to outcomes are also described and analyzed, including gender, age, prior criminal history, and features of the current arrest offense or offenses. Next, statistical testing is used to determine whether race/ethnicity plays a role in predicting disposition outcomes above and beyond differences across groups in these other relevant legal and demographic factors (see Appendix B for detail).

Limitations

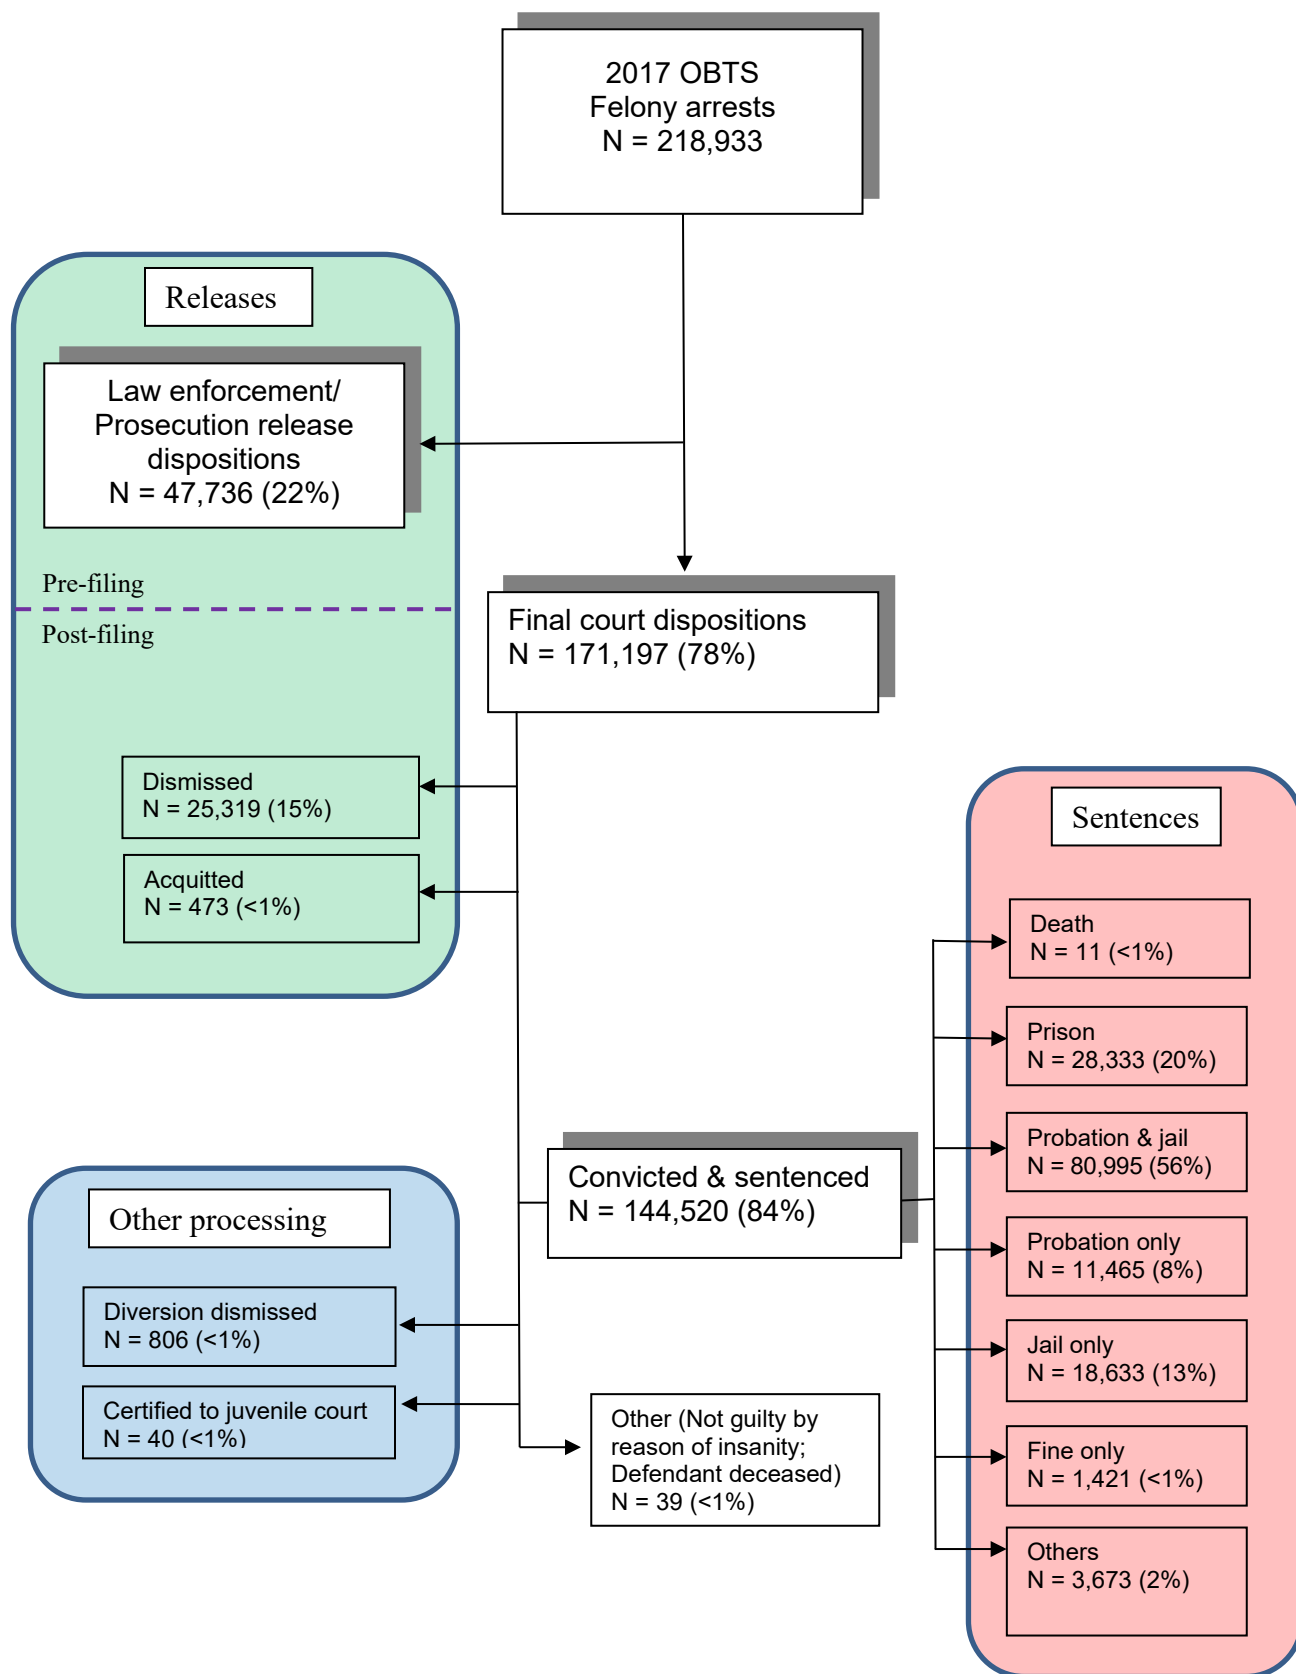

Differences in the disposition of misdemeanor arrests by race/ethnicity are not addressed in this report. OBTS is not a complete record of all felony arrests in the state, but rather the subset of those with final dispositions in 2017 reported to the DOJ—estimated by the Criminal Justice Statistics Center (CJSC) to be about 65 to 75 percent of all felony arrests disposed in the 2017 calendar year. The OBTS data focus on the most serious arrest charge, without providing additional detail on secondary arrest offenses. OBTS sentencing data contain the category of sentences (e.g., prison or jail), but do not include the length of sentence. Similarly, prior criminal records are grouped into broad categories. An analysis of more detailed data would allow for the control of a wider array of factors that may account for more of the differences in outcome based on race and ethnicity.⁵

None of the results found in this report can be taken as causal evidence of discrimination or bias at any point in the system. The analyses presented here are correlational, and any correlations between race and outcomes could be the result of more detailed case information not contained in OBTS. Additionally, each outcome discussed is reached through the interaction of many actors and structural elements within the system, and so cannot be attributed to any single actor. It is important to note that approximately 97 percent of convictions are a result of plea bargain agreements in which both the prosecutor and defense agree to the terms prior to judicial action.

⁴ Nonprison sentences in OBTS are referred to as miscellaneous sentences and include jail, probation, combined probation and jail, and fines.

⁵ Examples of more detailed data include information on prior offense type, warrants, and prior probation or parole violations.

Figure 1: Numbers of Dispositions at Distinct Case Processing Stages in OBTS (2017)

Demographics of Felony Defendants

Gender

Males made up 80.8 percent of the defendants reported to have received a court disposition in 2017; females made up 19.2 percent. Compared to the state as a whole, in which males are 50 percent of the population,⁶ felony defendants are disproportionately male (80.8 percent).

Age

Relative to the state's population, felony defendants are more concentrated between the ages of 20–39 years of age (figure 2).⁷ Compared to the California population, defendants ages 20–29 (38.5 percent) and 30–39 (30.5 percent) were arrested for felony-level offenses at disproportionately high rates, and those aged 40–49 (15.6 percent) at somewhat higher rates. Defendants aged 15–19 (4 percent) and 60 or older (2.7 percent) were arrested at disproportionately lower rates relative to the state's population, and those ages 50–59 (8.7 percent) at somewhat lower rates.⁸

⁶ Data on gender/sex are based on the California Department of Finance's total state population estimate for 2017, www.dof.ca.gov/Forecasting/Demographics/Projections/.

⁷ The OBTS file contains the date of birth and date of disposition for each felony defendant, from which we calculate "age at the time of disposition." This information was classified into the following age categories: ages 15–19, 20–29, 30–39, 40–49, 50–59, and 60 or older.

⁸ Age data were drawn from the California Department of Finance's total state population estimate for 2017, www.dof.ca.gov/Forecasting/Demographics/Projections/.

Race/ethnicity

Throughout the report, the terms *race* and *ethnicity* are based on U.S. Census Bureau categorizations. As with age and gender, the racial and ethnic makeup of felony defendants differs from the general population (figure 3). Black individuals make up 19.5 percent of felony defendants and 5.7 percent of the total California population. Asian/Pacific Islander (PI) individuals make up 3.3 percent of felony defendants compared to 13.9 percent of the general population. Hispanic individuals make up 43.2 percent of felony defendants and 39.5 percent of the overall state population, and white individuals represent 34 percent of felony defendants and 37.8 percent of the general population.

Prior criminal record

The vast majority of felony cases in the data set involved defendants who already had a criminal record (figure 4). Only 10.8 percent of felony defendants had no identified prior criminal record. Nearly 20 percent had one or more identified prior prison commitments, while the majority of defendants (64.6 percent) had prior criminal history not involving prison commitment, which OBTS labels as a “miscellaneous” prior record.⁹ A small number of defendants (4.8 percent) had an unspecified prior record.¹⁰

⁹ OBTS contains limited information on prior criminal record; no further distinctions are available in the “miscellaneous prior record” category.

¹⁰ This category, according to the OBTS technical manual and denoted by a blank for this field, represents a “lengthy record (prior to 1982).” This category will not be looked at in the analyses due to the lack of specificity, as it is unknown whether these criminal records involve a prior prison commitment.

Figure 4: Prior Record of Felony Defendants

Arrest offense type

The largest proportion of felony defendants in OBTS were arrested for violent crimes (32.4 percent), followed by defendants arrested for property offenses (29.4 percent) and other felony offenses (22.5 percent). Defendants arrested for drug offenses (15.7 percent) comprised the smallest group in the OBTS file for calendar year 2017.¹¹

Figure 5: Arrest Offense Type for Felony Defendants

¹¹ Categories are based on those used by the Bureau of Justice Statistics. Violent offenses include homicide, rape, robbery, and assault. Property offenses include burglary, theft, forgery, and arson. Drug offenses include all felony-level drug offenses. Other felony offenses include all weapons offenses and a range of other offenses such as vandalism and driving under the influence of drugs or alcohol.

Outcomes

This report presents findings based on three case outcomes:

- Conviction rates (i.e., whether a case results in a conviction or alternatively in a dismissal or acquittal);
- Conviction offense level (i.e., whether the case resulted in a felony or misdemeanor conviction); and
- Type of sentence (i.e., whether the defendant was sentenced to prison or received a lesser sentence).

The construction of each outcome from the OBTS data set is described briefly below.

Conviction Versus Acquittal/Dismissal

Once a case has been filed with the court, the case may result in either a conviction or alternatively in a dismissal or acquittal.¹² Dismissal and acquittal are combined into a single category in the following analyses because there are too few acquittals (473 acquittals versus 25,319 dismissals) to analyze on their own. It is important to note that the vast majority (97 percent) of convictions are achieved by plea bargaining deals that are negotiated between the prosecution and defense prior to judicial decisionmaking.¹³

Felony Versus Misdemeanor Conviction

Although all arrest charges in the OBTS data set are felony-level arrests, a reduction in charges may occur by plea deal or dismissal of the primary felony charge, resulting in conviction on a secondary misdemeanor charge or an infraction.¹⁴ Overall, felony convictions made up 57.4 percent and misdemeanors 42.6 percent of convictions. In this report, the term “felony conviction rate” is used to refer to the percentage of defendants whose conviction was for a felony-level offense as opposed to a lesser offense.

¹² Other possible outcomes are diversion dismissed (n = 806) or certified to juvenile court (n = 40; this occurs when the case is filed as an adult case but it is later found that the defendant was in fact a juvenile at the time of the alleged offense), which have been removed from analysis because the numbers are too small to analyze separately and they do not conceptually fit with either conviction or dismissal/acquittal.

¹³ OBTS does not have a data field for whether a case was resolved by plea or by trial, so it is impossible to analyze these outcomes separately. The percentage of convictions achieved by plea deal were calculated from Judicial Council of Cal., *2017 Court Statistics Report: Statewide Caseload Trends 2006–2007 Through 2015–2016*, www.courts.ca.gov/documents/2017-Court-Statistics-Report.pdf. This is comparable to the proportion of convictions achieved by plea found in other states (95 percent of felony convictions, likely even higher for misdemeanor convictions). Bureau of Justice Statistics, *State Court Sentencing of Convicted Felons 2004*, www.bjs.gov/content/pub/html/scscf04/tables/scs04401tab.cfm.

¹⁴ The small number of cases in this data set resulting in infraction conviction (201) were included in the misdemeanor category since there were too few to analyze infractions as its own category.

Prison Versus Intermediate Sentence

Sentencing is the final disposition outcome analyzed in this report.¹⁵ Sentences vary widely, and OBTS only provides the category of sentence without specifying sentence length. This report divides sentences into two categories: prison or intermediate sentence. Prison sentences are on average longer, and therefore are considered the more severe sentencing category¹⁶ in this report. All nonprison sentencing options are categorized in this report as “intermediate sentences.”¹⁷

Because convictions below the felony level are categorically ineligible for prison sentences, analyses of prison versus intermediate sentences are restricted to defendants convicted of a felony. Further restriction to prison-eligible felony crimes is challenging—although criminal justice realignment shifted sentencing such that in some cases sentences that previously would have been served in state prison are now served in county jail, the many exceptions based on criminal history and other factors make it difficult to achieve categorical separation among felonies.¹⁸ Therefore, all felony-level convictions are included in the analyses. The “prison sentence rate” discussed in the following analyses represents the proportion of all felony-level convictions receiving a prison sentence.

Observed Disposition Outcomes

Prior Criminal Record

Prior criminal record has significant impact on whether a defendant is convicted, receives a felony or misdemeanor conviction, and, if convicted of a felony, receives a prison sentence. Figure 6 arrays each outcome (rows) by prior criminal record, arrest offense and race/ethnicity (columns). The first column shows that the effect of prior criminal history is consistent for each outcome. For example, the conviction rate ranges from a low of 79.2 percent for those with no prior record to a high of 87 percent for those with a prior prison record. Similarly, the share of those convicted of a felony versus a misdemeanor ranges from 45.3 percent for those with no prior record to 71.3 percent for those with a prior prison record. And finally, the share of convicted felons sentenced to prison was 20 percent for those without a prior prison record and 61 percent for those with a prior prison record.

Arrest Offense

Arrest offense type also has significant impact on whether a defendant is convicted, receives a felony or misdemeanor conviction, and, if convicted of a felony, receives a prison sentence. However, the pattern varies based on the outcome. For example,

¹⁵ Plea deals represent approximately 97 percent of convictions in California and may impact sentencing outcomes. See *2017 Court Statistics Report*, www.courts.ca.gov/documents/2017-Court-Statistics-Report.pdf.

¹⁶ Death sentences were very scarce (11), and therefore were included in the prison category.

¹⁷ Other sentencing options in OBTS include jail, probation, combined probation and jail, and fines.

¹⁸ Assem. Bill 109 (Stats. 2011, ch. 15).

figure 6 (second column) illustrates the percentage of defendants convicted versus dismissed/acquitted by arrest offense type. The highest conviction rates (row 1) are for property offenses (87.9 percent), and the lowest for drug offenses (80 percent). Felony conviction rates (row 2) for violent and drug crimes both hover near 55 percent, while the felony conviction rate for property crimes is 62.2 percent. Prison sentencing rates (row 3) range from about 25 percent for drug and property crimes to 45 percent for violent crimes.

Race/Ethnicity

The percentage of individuals convicted versus dismissed/acquitted by race/ethnicity without taking any other factors into account is also presented in figure 6 (third column). For all racial/ethnic groups, conviction rates are high (83–87 percent). They range from a low of 82.7 percent for the Asian/PI group to a high of 87.3 percent for the Hispanic group. Felony conviction rates range from a low of 55 percent for the white group, to 57.8 percent for the Hispanic group, and to a high of 61.8 percent for the black group. The percentage of individuals who received a sentence to prison as opposed to an intermediate sentence shows that prison sentences were lower for white (28 percent) and Asian/PI (29 percent) groups, and higher for black (40 percent) and Hispanic (38 percent) groups.

Figure 6: Observed Outcomes by Prior Criminal History, Arrest Offense Type, and Race/Ethnicity

Note: These graphs show the overall percentages, not controlling for other factors.

Outcomes for Similarly Situated Defendants

The last column in figure 6 illustrates that Hispanics have conviction rates of 87.3 percent, whites' rates are 83.1 percent, and Asians and blacks have rates of slightly under 83 percent. Asian/PI (52.9 percent) and whites (54.9 percent) have a lower rate of felony convictions relative to blacks (61.8 percent) and Hispanics (54.9 percent). When convicted of a felony, blacks (40.3 percent) and Hispanics (37.5 percent) receive prison sentences more often than whites (28.3 percent). However, the differences between racial/ethnic groups in these outcomes are confounded by the differences between groups in criminal history, features of the current offense or offenses, gender, and age. For racial/ethnic differences in these characteristics, see Appendix B, table B1. The following section corrects for these differences in order to compare outcomes for defendants who are similarly situated in terms of age, gender, and legal factors available through OBTS.¹⁹

Conviction Rates for Similarly Situated Defendants by Race/Ethnicity

Using statistical methods that control for the confounding effects of differences between groups in age, gender, and legal factors, Hispanic individuals are estimated to be 3.6 percent more likely to receive a conviction than whites. If this estimation had been 0 percent instead of 3.6 percent, this would mean that age, gender, and legal factors predicted all of the differences in conviction rates by race/ethnicity. Applying the 3.6 percent difference to the observed conviction rate of Hispanics of 87.3 percent, this would be equivalent to a conviction rate of 84.3 percent for whites with the same age, gender, and legal makeup as the Hispanic group (see figure 7).

The statistical method estimated that conviction was 1.9 percent less likely for black individuals as compared to whites, and 0.01 percent more likely for Asian/PI individuals as compared to whites. The difference for Asian/PI individuals was not statistically significant. Using the same technique described above, figure 7 shows the differences in observed conviction rates and estimated conviction rates for similarly situated whites.

¹⁹ Defendants may not be similarly situated based on other unobserved variables; “similarly situated” is an approximation based on available data.

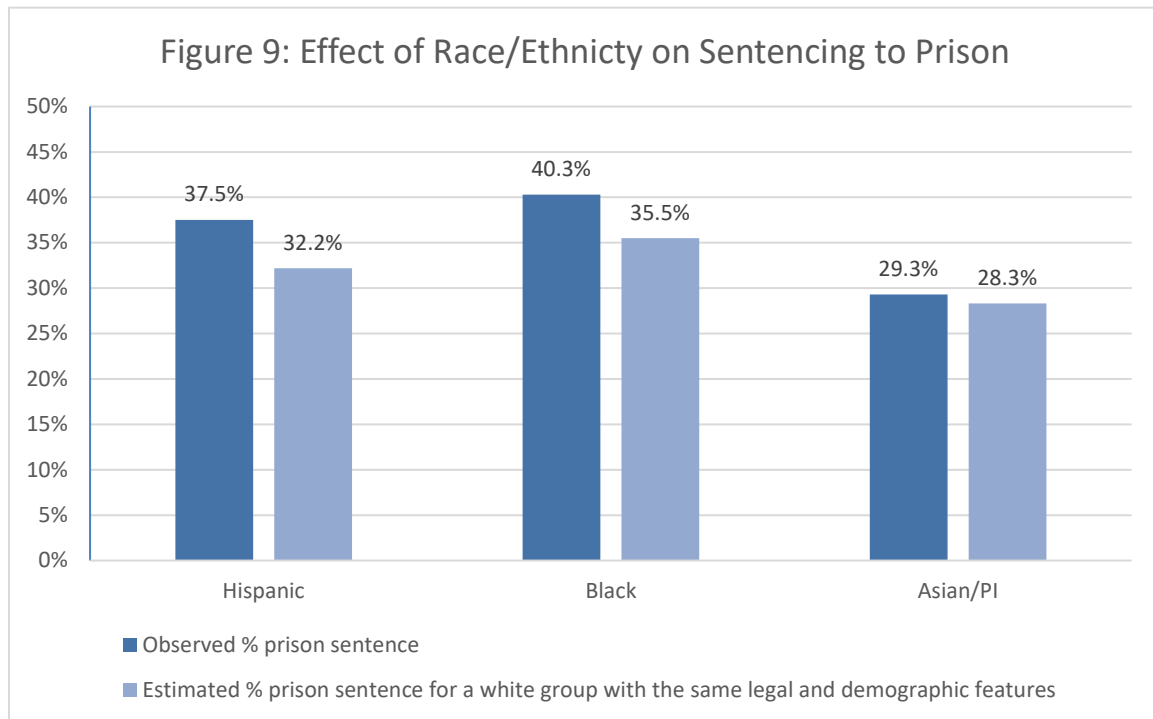

Felony Versus Misdemeanor Conviction Rate for Similarly Situated Defendants by Race/Ethnicity

The effect of race/ethnicity on felony conviction rate was estimated using the same technique described above. The statistical method estimated that felony conviction was 2.2 percent more likely for Hispanic individuals as compared to whites when controlling for age, gender, and legal factors. Black individuals were estimated to be 5.4 percent more likely to receive a felony conviction and Asian/PI individuals 1.5 percent less likely as compared to whites. The difference for Asian/PI individuals was not statistically significant. Figure 8 shows the differences in observed felony conviction rates and estimated felony conviction rates for similarly situated whites.

Sentencing for Similarly Situated Individuals by Race/Ethnicity

Again, using the same technique described above, figure 9 shows the differences in observed prison sentencing rates and estimated prison sentencing rates for similarly situated whites. The statistical method estimated that prison sentencing was 16.6 percent more likely for Hispanic individuals and 13.5 percent more likely for black individuals as compared to whites when controlling for age, gender, and legal factors. Asian/PI individuals were estimated to be 2.6 percent more likely to receive a prison sentence as compared to whites, but this difference was not statistically significant.

Summary of Findings

Legal factors such as the type of offense and the defendant's prior criminal record exerted the strongest influence on conviction rate, felony versus misdemeanor conviction, and sentencing to prison.²⁰ More serious offenses and prior records were both associated with higher conviction rates, more felony versus misdemeanor convictions, and more prison sentences.

After controlling for legal factors, the study found that defendant characteristics such as race/ethnicity, gender, and age are still significantly associated with rates of conviction, rates of felony versus misdemeanor convictions, and imposition of a prison versus an intermediate sentence.

After controlling for all available legal and demographic factors:

- Relative to black and white defendants, Hispanic defendants were more likely to be convicted rather than be acquitted or have their cases dismissed;
- White defendants were less likely to receive a felony versus a misdemeanor conviction when compared to black and Hispanic defendants; and
- Relative to whites, black and Hispanic individuals convicted of a felony were more likely to receive a sentence to prison rather than an intermediate sentence.

These findings are consistent with prior years' reports.²¹

²⁰ As determined by a comparison of McFadden pseudo R-squared values which estimate the relative contribution of each predictor to the overall predictive power of the statistical model. See Appendix B for more detail.

²¹ See Appendix C.

Appendix A

Penal Code section 1170.45:

The Judicial Council shall collect data on criminal cases statewide relating to the disposition of those cases according to the race and ethnicity of the defendant, and report annually thereon to the Legislature beginning no later than January 1, 1999. It is the intent of the Legislature to appropriate funds to the Judicial Council for this purpose.

Appendix B

This appendix contains a table (table B1) of the characteristics of felony defendants in the OBTS database and the regression results referred to in this report. Regression is a statistical process of determining the relationship between an outcome of interest and a set of predictors. The mathematical equation that is used to determine this relationship contains the predictors being examined and is referred to as a “model”.

For conviction rate and level of conviction offense, the items included in the model were:

- Prior criminal record;
- Arrest offense type;
- Number of arrest charges;
- Age;
- Gender;
- Race;
- DOJ offense hierarchy value for arrest offense;
- Whether the arrest offense was serious; and
- Whether the arrest offense was violent.

For sentencing, the items included in the model were:

- Prior criminal record;
- Conviction offense type;
- Number of convictions;
- Age;
- Gender;
- Race;
- DOJ offense hierarchy value for conviction offense;
- Whether the conviction offense was serious; and
- Whether the conviction offense was violent.

Poisson regression was used with robust standard errors. Poisson regression is a specific type of regression ideal for estimating relative risk (the ratio of the probability of an outcome for one group over another), and robust standard errors ensure that the significance of the results can be accurately assessed.

A likelihood ratio test was used to compare the model strength for each model with and without race/ethnicity. These tests demonstrate that a model which includes race as a predictor is significantly more predictive than a model without race.²²

²² For each outcome $p < 2.2e-16$, indicating it is extremely unlikely to observe this difference by chance if the two models were equally predictive.

Table B1: Characteristics of Felony Defendants

	Total %	Asian/PI %	Black %	Hispanic %	White %
All defendants	--	3.3	19.7	43.3	33.7
Outcome Variables					
<i>Case Outcome</i>					
Acquittal or Dismissal	15.1	17.3	17.2	12.7	16.9
Conviction	84.9	82.7	82.8	87.3	83.1
<i>Conviction type (among convictions)</i>					
Misdemeanor	42.6	47.1	38.2	42.2	45.1
Felony	57.4	52.9	61.2	57.8	54.9
<i>Sentence Outcome (among felonies)</i>					
Intermediate Sentence	65.1	70.7	59.7	62.5	71.7
Prison or Death	34.9	29.3	40.3	37.5	28.3
Situational Variables					
<i>Arrest Offense Type</i>					
Violent	32.1	27.4	38.6	32.8	27.9
Property	29.2	29.2	27.1	28.0	31.9
Drug	15.0	22.3	11.0	14.4	17.5
Other	23.8	21.1	23.6	24.8	22.7
<i>Arrest Offense Serious</i>					
Serious	9.8	8.8	11.2	10.1	8.7
Nonserious	90.2	91.2	88.8	89.9	91.3
<i>Arrest Offense Violent</i>					
Violent	7.9	5.4	11.9	8.0	5.6
Nonviolent	92.1	94.6	88.1	92.0	94.4
<i>Arrest Offense DOJ Hierarchy*</i>					
Average hierarchy value	0	0.006	-0.101	-0.007	0.068
<i>Prior Record</i>					
None	10.8	23.8	8.4	11.2	10.5
Miscellaneous	64.6	59.7	59.1	66.5	65.8
Prior Prison	19.8	14.5	25.2	18.9	18.3
Lengthy record (before 1982)	4.8	2.0	7.3	3.4	5.4
Defendant Characteristics					
<i>Gender</i>					
Male	80.9	80.9	80.7	84.2	76.7
Female	19.1	19.1	19.3	15.8	23.3
Average Age	34.0	35.6	34.1	31.8	36.5
Number of Cases	165,533 [†]	5,425	32,616	71,691	55,801

* The DOJ produces a hierarchy of criminal codes with higher values representing less severe crimes. The variable has been scaled for ease of interpretability so that the overall mean hierarchy value is 0 and the standard deviation is 1. Negative values represent average hierarchy values more severe than the mean.

[†] Excluding defendants of other races and genders, and those missing California Information and Identification numbers.

Table B2: Robust Poisson regression predicting conviction versus dismissal/acquittal

n = 156,007

Excluding those with outcomes other than acquitted/dismissed, intermediate sentence, or prison sentence, as well as those for whom Criminal Justice Information Services codes could not be matched to DOJ offense hierarchy.

* p<0.05; ** p<0.01; *** p<0.001

† p represents the probability that these results could be obtained by chance if that predictor did not have any predictive value. P-values below 0.05 are typically viewed as representing a “significant” result – that the estimate is unlikely to have occurred by chance if there were no true effect.

Table B3: Pseudo R-squared results for model predicting conviction versus dismissal/acquittal

Contribution for each variable calculated by taking the McFadden pseudo R-squared value for the full model and subtracting the McFadden pseudo R-squared value for a model without that variable. McFadden pseudo R-squared values are difficult to interpret individually, but the relative values give information about the relative contribution of each predictor to the overall predictive power of the model.

Table B4: Robust Poisson regression predicting felony versus misdemeanor conviction

Variable	Estimate (Robust Standard Error)	Relative Risk	p^{\dagger}
(Intercept)	-0.967 (0.010)	0.380	<2e-16 ***
Prior record: Lengthy record (prior to 1982)	0.353 (0.015)	1.424	<2e-16 ***
Prior record: Miscellaneous prior record	0.217 (0.010)	1.242	<2e-16 ***
Prior record: Prior prison	0.461 (0.011)	1.586	<2e-16 ***
Arrest offense type: Drug	-0.173 (0.008)	0.841	<2e-16 ***
Arrest offense type: Other	0.013 (0.007)	1.013	0.0623
Arrest offense type: Violent	-0.462 (0.008)	0.630	<2e-16 ***
Multiple arrest charges	-0.003 (0.002)	0.997	0.0773
Age	-0.003 (0.0002)	0.997	<2e-16 ***
Gender: Female	-0.128 (0.007)	0.880	<2e-16 ***
Race/ethnicity: Asian/PI	-0.015 (0.015)	0.985	0.318
Race/ethnicity: Black	0.053 (0.007)	1.054	5.83e-15 ***
Race/ethnicity: Hispanic	0.022 (0.006)	1.022	0.00017 **
DOJ hierarchy (arrest offense, scaled)	-1.144 (0.003)	0.319	<2e-16 ***
Serious (arrest offense)	0.291 (0.009)	1.338	<2e-16 ***
Violent (arrest offense)	0.389 (0.009)	1.475	<2e-16 ***

n = 116,770

Excluding those with missing data for type of conviction.

* p<0.05; ** p<0.01; *** p<0.001

† p represents the probability that these results could be obtained by chance if that predictor did not have any predictive value. P-values below 0.05 are typically viewed as representing a “significant” result – that the estimate is unlikely to have occurred by chance if there were no true effect.

Table B5: Pseudo R-squared results for model predicting felony versus misdemeanor conviction

Table B6: Robust Poisson regression predicting prison sentence versus intermediate sentence

	Estimate (Robust Standard Error)	Relative Risk	p^\dagger
(Intercept)	-2.129 (0.033)	0.119	<2e-16 ***
Prior record: Lengthy record (prior to 1982)	0.946 (0.035)	2.575	<2e-16 ***
Prior record: Miscellaneous prior record	0.394 (0.027)	1.483	<2e-16 ***
Prior record: Prior prison	1.254 (0.026)	3.505	<2e-16 ***
Conviction offense type: Drug	-0.130 (0.021)	0.878	3.34e-10 ***
Conviction offense type: Other	0.446 (0.014)	1.562	<2e-16 ***
Conviction offense type: Violent	0.349 (0.015)	1.418	<2e-16 ***
Multiple convictions	0.077 (0.003)	1.080	<2e-16 ***
Age	-0.006 (0.0005)	0.994	<2e-16 ***
Gender: Female	-0.611 (0.022)	0.543	<2e-16 ***
Race/ethnicity: Asian/PI	0.025 (0.034)	1.026	0.451
Race/ethnicity: Black	0.127 (0.014)	1.135	<2e-16 ***
Race/ethnicity: Hispanic	0.153 (0.012)	1.166	<2e-16 ***
DOJ hierarchy (arrest offense, scaled)	-0.176 (0.008)	0.839	<2e-16 ***
Serious (arrest offense)	0.148 (0.016)	1.160	<2e-16 ***
Violent (arrest offense)	0.362 (0.015)	1.436	<2e-16 ***

n = 69,301

* p<0.05; ** p<0.01; *** p<0.001

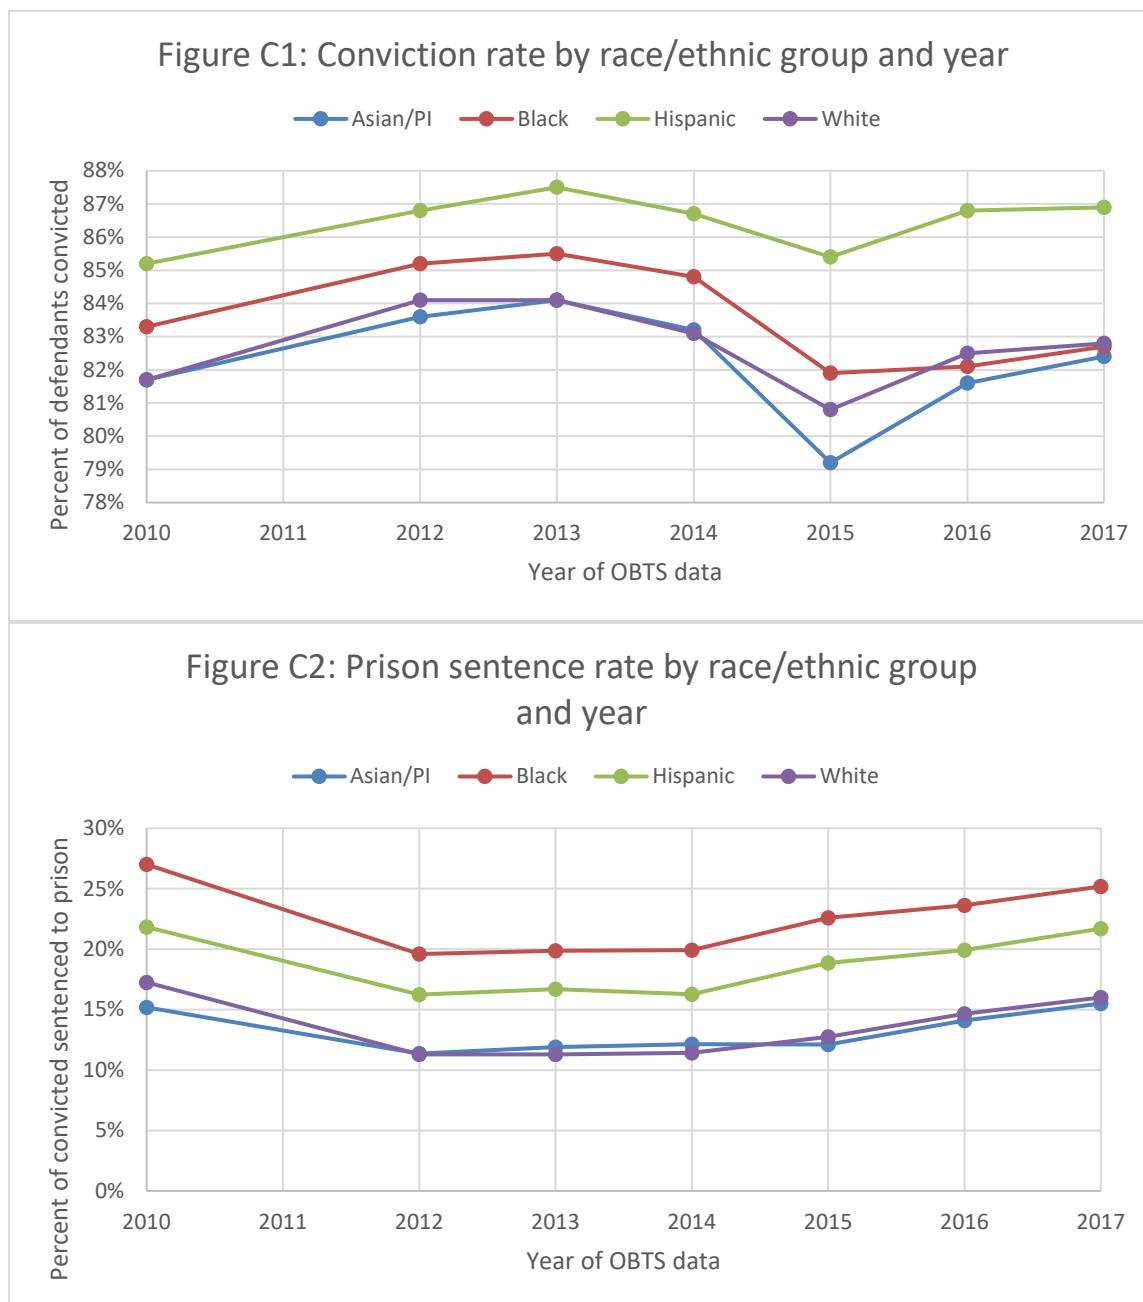

† p represents the probability that these results could be obtained by chance if that predictor did not have any predictive value. P-values below 0.05 are typically viewed as representing a “significant” result – that the estimate is unlikely to have occurred by chance if there were no true effect.

Table B7: Pseudo R-squared results for model predicting prison versus intermediate sentence

Appendix C

Descriptive data from previous years' reports²³ (compiled in figures C1 and C2) suggest that the trends found in this year's report are consistent with that of prior years.²⁴ Additional research is needed to gain a clearer understanding of what is driving these trends.

Note: These graphs show overall percentages, not controlling for prior record, offense features, age, or gender. Data not available for calendar year 2011.

²³ For figure C2, the prison sentence rate is out of all convicted defendants, not solely those charged with felonies, in order to be consistent with previous years' analyses.

²⁴ Felony versus misdemeanor conviction charge is not graphed because recent years' reports did not analyze this outcome.

Appendix D

The analyses presented in this report represent average differences across each racial/ethnic group. The following charts show the more nuanced patterns of outcomes broken down by race/ethnicity, prior criminal record, and arrest offense type. Since the numbers for Asian/PI defendants are comparatively small, caution should be used in interpreting the subsetting percentages visualized below.

These graphs show the observed percentages, not controlling for prior record, arrest offense, number of arrest charges, age, or gender. “Other felony” type is not shown due to the lack of interpretability of such a broad category of offenses.

Figure D1a. Arrest Offense Type: Violent
Percent convicted

Figure D1b. Arrest Offense Type: Drug
Percent convicted

Figure D1c. Arrest Offense Type: Property
Percent convicted

Figure D2a: Arrest Offense Type: Violent
Percent of convicted defendants with felony conviction

Figure D2b: Arrest Offense Type: Drug
Percent of convicted defendants with felony conviction

Figure D2c: Arrest Offense Type: Property
Percent of convicted defendants with felony conviction

Figure D3a: Arrest Offense Type: Violent
Percent of felony convicted defendants given a prison sentence

Figure D3b: Arrest Offense Type: Drug
Percent of felony convicted defendants given a prison sentence

Figure D3c: Arrest Offense Type: Property
Percent of felony convicted defendants given prison sentence
